

Since 1960, the average annual maximum temperature in Vermont increased about 0.4°F per decade, while the average minimum temperature rose at 0.6°F per decade (Figure 25). Similarly, the average annual precipitation has risen 0.7” per decade since 1895 and 1.5” per decade since 1960<sup>7</sup> (Figure 26), suggesting increasing trends in both temperature and precipitation.

According to the 2014 National Climate Assessment, the average annual precipitation in the United States has increased by approximately 5%<sup>8</sup>. Of particular note, the Assessment also identifies the northern U.S. as being more likely to experience above average precipitation in the winter and spring, with even wetter conditions expected under a high greenhouse gas emissions scenario. In addition to higher annual precipitation in both the observed record and projected models, the northeastern United States is also projected to experience more frequent, heavier rainfall events. Since 1991, the incidence of these heavy precipitation events has been 30% above average<sup>9</sup>.

Another climate change concern in Vermont is the potential for climate refugees. As portions of the U.S. become more arid and as sea levels continue to rise, Vermont may begin to see significant increases in population. One study on sea-level rise displacement projects over 4,000 migrants to Vermont from across the U.S., most predominately in Chittenden County. This study does not account for people moving from increasingly arid areas within the U.S. or from outside of the U.S., which may also increase net immigration. Based on the unpredictable nature and potential impact of an influx of climate refugees into the State, the Steering Committee decided to acknowledge climate refugees as a potential future hazard facing Vermont, to be reassessed during the next SHMP update.

## HAZARD ASSESSMENT

A risk assessment is used to measure the potential loss of life, personal injury, economic impact, and property damage resulting from natural hazards by analyzing the vulnerability of people, the built environment, the economy and the natural environment. VEM staff used several methods to identify risks in Vermont, including the evaluation of historical data, consideration of changing climate trends, and feedback from stakeholders. This examination involved an extensive review of natural disasters in Vermont, both declared and undeclared. Man-made and technological hazards are covered extensively in the 2018 Vermont State Emergency Management Plan (SEMP), which follows a risk assessment methodology similar to that used in this Plan. Accordingly, the following sections of the risk assessment identify the natural hazards that Vermonters can expect to face over the next fifty years and beyond, and the mitigation strategies section reviews the actions underway or planned to address these hazards and risks. As noted in the 2013 SHMP, and confirmed again in this 2018 SHMP, the natural hazards not incorporated are coastal erosion, expansive soils, Karst topography, sinkholes, tsunamis and volcanoes. These hazards are considered non-significant, unlikely hazards in Vermont and therefore do not warrant extensive review and consideration in this Plan. Table 19 explains how each hazard addressed in the 2013 SHMP was considered in this Plan.

## Hazard Events

One of the most significant changes from the 2013 Plan to the 2018 Plan is the way hazards are assessed. Instead of continuing to view hazards as events (e.g. hurricanes), the 2018 SHMP assesses the impacts of events (e.g. inundation flooding, fluvial erosion, and wind as impacts of a hurricane event), as it is the impacts, not the events, that can be mitigated. Table 15 represents the initial analysis of hazard events by the Steering Committee, which informed the creation of the hazard impact assessment.

7 <http://climatechange.vermont.gov/our-changing-climate/dashboard/more-annual-precipitation>

8 <https://nca2014.globalchange.gov/report/our-changing-climate/precipitation-change>

9 <https://nca2014.globalchange.gov/report/our-changing-climate/heavy-downpours-increasing>

**Table 15: Hazard Events Assessment**

Hazard Events	Hazard Type	Probability	Hazard Impacts
Rainstorm/Thunderstorm	Meteorological	Highly Likely	Erosion; Inundation; Wind; Hail; Lightning
Winter Storm	Meteorological	Likely	Snow; Ice; Wind
Landslide	Geological	Likely	Inundation; Erosion
Drought	Meteorological	Likely	
Tropical Storm/Hurricane	Meteorological	Occasionally	Erosion; Inundation; Wind
Ice Jam	Meteorological	Occasionally	Inundation; Erosion
Tornado	Meteorological	Occasionally	Hail; Wind
Wildfire	Meteorological	Occasionally	
Earthquake	Geological	Occasionally	

## Hazard Impacts

The Steering Committee ranked the natural hazard impacts associated with the events listed above. Table 16 presents that ranking, including the probability of occurrence and potential impact to infrastructure, life, economy and the environment. Table 17 details the hazard assessment ranking criteria.

**Table 16: 2018 Hazard Assessment**

Hazard Impacts	Probability	Potential Impact					Score*:
		Infrastructure	Life	Economy	Environment	Average:	
Fluvial Erosion	4	4	3	4	4	3.75	15
Inundation Flooding	4	4	3	4	2	3.25	13
Ice	3	3	3	3	2	2	8.25
Snow	4	1	3	2	1	1.75	7
Wind	4	2	2	1	1	1.5	6
Heat	3	1	3	2	2	2	6
Cold	3	1	3	2	2	2	6
Drought	3	1	2	2	3	2	6
Landslides	3	3	2	1	2	2	6
Wildfire	2	3	3	3	2	2.75	5.5
Earthquake	2	3	3	3	2	2.75	5.5
Invasive Species	2	1	1	2	3	1.75	3.5
Infectious Disease Outbreak	2	1	3	2	1	1.75	3.5
Hail	3	1	1	1	1	1	3

\*Score = Probability x Average Potential Impact

**Table 17: Hazard Assessment Ranking Criteria**

	<b>Frequency of Occurrence:</b> Probability of a plausibly significant event	<b>Potential Impact:</b> Severity and extent of damage and disruption to population, property, environment and the economy
1	Unlikely: <1% probability of occurrence per year	Negligible: isolated occurrences of minor property and environmental damage, potential for minor injuries, no to minimal economic disruption
2	Occasionally: 1–10% probability of occurrence per year, or at least one chance in next 100 years	Minor: isolated occurrences of moderate to severe property and environmental damage, potential for injuries, minor economic disruption
3	Likely: >10% but <75% probability per year, at least 1 chance in next 10 years	Moderate: severe property and environmental damage on a community scale, injuries or fatalities, short-term economic impact
4	Highly Likely: >75% probability in a year	Major: severe property and environmental damage on a community or regional scale, multiple injuries or fatalities, significant economic impact

The hazards and explanations of their relative probability and impact scores are detailed in the individual hazards assessment sections below. While these hazards are profiled individually, this Plan and the hazard assessment sections recognize that hazards do not occur in silos; many of the hazards are inter-related and often occur in tandem. To highlight the most significant relationships, the fluvial erosion and inundation flooding assessments were combined, as well as the ice and snow storm assessments. Each individual hazard assessment section also references the other pertinent hazards and their content, when applicable.

Beyond the potential of simultaneous occurrence, several of the hazards also have the potential to *cause* other hazards. Causal relationships are identified in Table 18 (with causal hazards identified in green and resulting hazards identified in blue) and further addressed in pertinent hazard assessment sections. Combined with the projected increases in both precipitation and temperature, this assessment highlights the more significant compounding impacts that Vermont can anticipate in the future due to climate change.

**Table 18: Causal Relationships Between Hazard Impacts**

Secondary Hazard Impact (Result)	Fluvial Erosion	Inundation Flooding	Ice	Snow	Wind	Heat	Cold	Drought	Landslides	Wildfire	Earthquake	Invasive Species	Infectious Disease	Hail
Primary Hazard (Causal)	Fluvial Erosion	Inundation Flooding	Ice	Snow	Wind	Heat	Cold	Drought	Landslides	Wildfire	Earthquake	Invasive Species	Infectious Disease	Hail
Fluvial Erosion														
Inundation Flooding														
Ice														
Snow														
Wind														
Heat														
Cold														
Drought														
Landslides														
Wildfire														
Earthquake														
Invasive Species														
Infectious Disease														
Hail														

**Table 19: Hazard Assessment Changes from the 2013 SHMP**

Hazards Addressed in 2013	Hazards Addressed in 2018
Flooding and Fluvial Erosion	<b>Inundation Flooding; Fluvial Erosion</b>
Terrorism	Man-made hazards removed.
Earthquakes	<b>Earthquake</b>
Infectious Disease Outbreak	<b>Infectious Disease</b>
Hurricanes/Tropical Storms	Hazard impacts separated ( <b>Inundation Flooding; Fluvial Erosion; Wind</b> )
Tornadoes	Hazard impacts separated ( <b>Wind; Hail</b> )
Nuclear Power Plant Failure	Man-made hazards removed. Vermont's only nuclear power plan has been decommissioned.
Landslides/Rockslides	<b>Landslides</b>
Severe Thunderstorms	Hazard impacts separated ( <b>Inundation Flooding; Fluvial Erosion; Wind; Hail</b> )
Wildfires	<b>Wildfire</b>
Dam Failure	Hazard impacts separated ( <b>Inundation Flooding; Fluvial Erosion</b> )
Severe Winter Storms	Hazard impacts separated ( <b>Ice; Snow</b> )
Hail	<b>Hail</b>
Ice Jams	Hazard impacts separated ( <b>Inundation Flooding; Fluvial Erosion</b> )
Drought	<b>Drought</b>
Rock Cuts	Man-made hazards removed.
Invasive Species	<b>Invasive Species</b>
Extreme Temperatures	Hazard impacts separated ( <b>Heat; Cold</b> )

## Jurisdictional Vulnerability

In conjunction with the risk assessment, VEM staff conducted a vulnerability assessment, which predicts the extent of damage that may result from a hazard event of a given intensity in a given area and considers damage to the existing and future built environment, the natural environment, and populations within Vermont. Vulnerability was determined by identifying the threats posed to people, property, the environment, and the economy. Hazard-specific vulnerability is detailed further in the individual hazard profiles.

Though a small state, Vermont's topography and mountainous setting can result in geographic isolation during severe storms, which can have significant localized impacts. A localized storm can drop a significant amount of water into a small watershed, devastating one town or cutting it off from the rest of the State, while causing no damage to an adjacent town on the other side of a mountain. The mountainous areas in Vermont vulnerable to these phenomena are numerous. Because of the steep mountain topography, damage from frequently occurring extreme weather events in any specific location may occur often or only once in a lifetime, which makes it difficult to plan for and responding to events.

Coupled with this topographic isolation, the rural nature of the State can also result in isolation from necessary emergency response efforts. Most communities in Vermont have an identified local Emergency Operations Center (EOC) and/or shelter for its residents, should an event warrant their opening and often require a back-up energy source, typically in the form of generators. In order to keep these critical facilities functioning in times of need, VEM is regularly contacted for equipment and training requests and financial assistance. Other critical facilities that have applied for funding through the State are wastewater treatment plants and fire departments, which require back-up energy sources during events that may result in community-wide power loss (e.g. flooding, wind storm, ice/snow storm), or which require flood-proofing to reduce vulnerability to flood damage.

### Jurisdictional Risk Assessments:

In an effort to validate the risk assessment completed by the Steering Committee, and as one of the metrics used to assess local vulnerability, VEM staff asked RPCs to rank the same list of hazards based on the perceived

**Table 20: Hazard Assessment Ranking by Regional Planning Commission**

Hazard Impact	Average	ACRPC	BCRC	CCRPC	CVRPC	LCPC	NRPC	NVDA	RRPC	SWCRPC	TRORC	WRC
Inundation Flooding	2.2	9	1	2	1	2	1	1	2	1	2	2
Fluvial Erosion	2.3	3	2	1	2	4	3	5	1	2	1	1
Snow	4.5	12	3	4	3	1	5	2	7	3	6	3
Ice	4.6	1	9	6	4	5	2	3	4	9	3	5
Wind	5.1	2	4	3	6	6	4	6	3	6	4	12
Cold	7.4	17	8	5	5	3	13	4	5	4	10	10
Invasive Species	8.0	4	6	10	10	9	11	13	8	--	5	4
Landslides	8.4	7	12	13	8	7	6	8	10	7	8	6
Wildfire	8.8	6	11	9	7	11	9	10	13	5	9	7
Drought	9.3	11	7	11	12	10	8	9	11	8	7	8
Hail	9.5	10	14	12	9	8	7	7	6	11	11	9
Infectious Disease	10.0	5	5	7	14	12	10	12	12	--	12	11
Heat	11.1	8	10	8	13	13	14	11	9	10	13	13
Earthquake	13.1	12	13	14	11	14	12	14	14	12	14	14

**Table 21: Hazards Addressed in Local Hazard Mitigation Plans  
Approved as of December 31, 2017**

Hazard	Approved LHMPs	Percent of Approved LHMPs
Flooding	165	97.1%
Winter Storms	132	79.4%
Fluvial Erosion	122	71.8%
Ice Storm	95	55.9%
High Wind	87	51.2%
Flash Flood	69	40.6%
Wildfires	47	27.6%
Hurricanes/Tropical Storms	42	24.7%
Thunderstorms	42	24.7%
Hail	39	22.9%
Landslides	39	22.9%
Extreme Cold	36	21.2%
Ice Jams	36	21.2%
Lightning	31	18.2%
Dam Failure	29	17.1%
Infectious Disease Outbreak	29	17.1%
Earthquake	27	15.9%
Drought	24	14.1%
Invasive Species	22	12.9%
Tornado	20	11.8%
Extreme Temperatures	19	11.2%

vulnerability in their respective regions. RPCs ranked vulnerability on a scale from 1-14, with 1 being the most significant and 14 being the least significant. Table 20 represents the responses from each RPC, with an average score based on all responses, ordered from most to least significant. The results of this analysis closely matched the hazard ranking completed by the Steering Committee, further confirming Vermont's most significant hazards (i.e. Fluvial Erosion, Inundation Flooding, Ice and Snow).

At the end of 2017, 170 of the 281 jurisdictions in Vermont had FEMA-approved Local Hazard Mitigation Plans (60.5%). In a review of these approved plans, VEM mitigation staff identified natural hazards that were addressed by more than 10 individual jurisdictions (Table 21). The analysis also confirms that the most significant concerns at the State level are consistent with

reality at the regional and local levels, with Flooding, Winter Storms and Fluvial Erosion and Ice Storm ranking as the most significant hazards.

In addition to ranking hazard significance, RPCs also listed the communities within their regions that are most vulnerable to natural hazards and explained what makes them vulnerable. The responses are represented in Table 22. VEM staff used this local vulnerability information to inform the assessment of each hazard and the mitigation strategy (see: [Mitigation Strategy](#)).

**Table 22: Local Vulnerability by Regional Planning Commission**

RPC	Municipality	Vulnerability
ACRPC	Bristol	Village was built on unstable gravel deposit prone to landside; large forest products industry threatened by invasive species.
ACRPC	Goshen	Most of town is within the Green Mountain National Forest and vulnerable to wildfire.
BCRC	Bennington	Significant amount of structures in floodplain, including downtown Bennington, vulnerable to flooding and fluvial erosion.
BCRC	Pownal	Over 100 mobile homes in the floodplain, vulnerable to flooding and erosion.
BCRC	Manchester	Second largest town in the region, which was cut off during Irene and is still vulnerable to flooding and fluvial erosion.
BCRC	Woodford	Over 40 homes in river corridor that are not in the flood zone. Town has not adopted river corridor protection and is vulnerable to erosion.

*Continued on pg. 51*

RPC	Municipality	Vulnerability
CCRPC	Bolton, Huntington, Richmond, Underhill, Westford	Steep roads vulnerable to fluvial erosion and flooding.
CVRPC	Barre City, Montpelier	Downtowns in floodplain prone to flooding and ice jams, vulnerable populations at risk due to cold, critical facilities potentially at risk, limited capacity to handle and store large volumes of snow.
CVRPC	Plainfield	Vulnerable to flooding due to topography and soils, debris jam potential, and public infrastructure in need of upgrade. Limited transportation routes and potential for isolation. Proximity to the Marshfield Dam.
CVRPC	Duxbury	Vulnerable to flooding due to topography and soils. 90% forested landcover, which is at risk of wildfire. Lack of dry hydrants; rural community with remote locations and vulnerable populations; potential for long-term power outages.
CVRPC	Waterbury Town/Village	Downtown location and critical facilities prone to flooding and near Waterbury Dam, age and condition of infrastructure, vulnerable populations, potential for long-term power outages.
LCPC	Johnson	Vulnerable to flood inundation and ice jams due to low lying downtown.
LCPC	Jeffersonville/Cambridge	Population in the floodplain vulnerable to inundation flooding and ice jams.
LCPC	Stowe	More densely developed along river, vulnerable to flood inundation and wind.
NRPC	Highgate	Forested land cover at risk of inundation and fluvial erosion, power lines vulnerable to ice, winds from the west gain strength over lake.
NRPC	Montgomery	Soils and topography create risk of flooding and erosion, power lines vulnerable to ice, remoteness and forested land cover, winds from the west gain strength over lake.
NRPC	Enosburgh Town	Fluvial erosion and inundation risk, power lines vulnerable to ice, forested land cover, winds from the west gain strength over lake.
NRPC	Isle La Motte	Island landform vulnerable to flood inundation, one road connects island to neighboring town, remote, power lines vulnerable to ice, winds from the west gain strength over lake.
NRPC	Swanton Town/Village	Pre-flood regulations development at risk of flood inundation, power lines vulnerable to ice, winds from the west gain strength over lake.
NVDA	Hardwick, Lyndonville, St. Johnsbury	Regional centers with high amount of development subject to flooding and fluvial erosion.
NVDA	Concord, Brownington, Barnet	Development and Infrastructure (roads) in flood zone and river corridor vulnerable to flooding and fluvial erosion.
RRPC	Mendon, Brandon, Pawlet, Rutland City	Infrastructure in the river corridor vulnerable to flooding and fluvial erosion.
SWRPC	Cavendish	Location and topography cause risk of inundation and erosion.
SWRPC	Chester	Critical facilities and infrastructure at risk of inundation and slope failure.
SWRPC	Windsor, West Windsor	Critical facilities vulnerable to inundation, erosion and drought.
SWRPC	Ludlow	Location puts infrastructure at risk from flooding.
TRORC	Stockbridge	Steep slopes that were damaged by Irene at risk of fluvial erosion, road infrastructure located near water bodies vulnerable to inundation risk.
TRORC	Woodstock, Newbury and Village of Wells River, Granville	Major public and private infrastructure located near waterways and vulnerable to erosion and inundation.
TRORC	Rochester	Major public and private infrastructure located near waterways and easily isolated during storm events, at risk of inundation and erosion.
WRC	Jamaica, Newfane	Historic development pattern cause vulnerability to fluvial erosion and inundation.
WRC	Marlboro	Topography and development patterns create a risk of fluvial erosion.
WRC	Wilmington, Wardsboro	Location of downtown and historic development pattern cause a risk of flooding and fluvial erosion.

**Vermont Economic Resiliency Initiative (VERI) Priority Areas:**

In 2015, the Agency of Commerce and Community Development (ACCD) completed the Vermont Economic Resiliency Initiative (VERI) report<sup>10</sup>. The report was developed to help Vermont communities better manage their flood risk and included an analysis that defined the top 32 communities where flooding risk is high, based on economic activity, at-risk infrastructure, and at-risk non-residential buildings. ACCD completed more detailed analyses for the top six communities, for which projects were defined that would reduce vulnerability and prioritize investment: Barre City and Town, Brandon, Brattleboro, Enosburg Village and Town, and Woodstock. In addition to these top communities, many of the priority areas have seen increased investment in mitigation work, as noted Table 23.

**Table 23: Economic Centers with Infrastructure and Commercial Buildings at Risk (VERI)**

Municipality	Economic Activity Ranking	2011 Population Estimate	Infrastructure Vulnerability Ranking	Vulnerable Commercial Buildings	Notes	Mitigation Progress in 2018
Brattleboro	4	11,978	6	73	Designated Downtown, Critical Employer	Buyout of Melrose Terrace and subsequent floodplain restoration along Whetstone Brook underway
Montpelier	7	7,868	11	300	Designated Downtown, Critical Employer	USACE Silver Jackets VT team awarded funding for updating floodmapping in 2017
Hartford	10	9,952	7	45	Designated Downtown	Several buyouts post-Irene
Barre City	15	9,066	12	169	Designated Downtown	Several buyouts, drainage upgrade projects
Ludlow	16	1,963	43	84	Tourism	Large drainage improvement project and several buyouts
Morristown	17	5,277	51	46	Designated Downtown, Critical Employer	N/A
Woodstock	19	3,047	24	140	Tourism	N/A
Cambridge	20	3,695	26	35	Tourism	Large floodplain restoration and drainage improvement projects underway

### Vulnerability of State-Owned Buildings:

Buildings and General Services (BGS), through a 2018 SHMP subgrant, is the lead agency for a statewide assessment of State-owned buildings located either in the FEMA-mapped floodplain and/or the river corridor. This assessment, which included all State-owned and leased properties, considered both criticality of the buildings' functions and the vulnerability of the structures based on location.

As the two most significant hazards identified in this Plan, the BGS risk assessment project focused primarily on fluvial erosion and flood inundation vulnerability. Further, assessing risk based on these hazards was fairly straightforward, as BGS could access both State and FEMA mapping data specific to fluvial erosion and inundation flooding. Using these data, BGS assessed vulnerability of an individual structure according to its proximity to the FEMA-mapped 100- and 500-yr floodplains, as well as the river corridor. An overall vulnerability score was assigned to each structure using a point system outlined in the [Appendix to Section 3](#). Structures were then assessed according to their criticality to the following State functions:

- Emergency Operations
- Government Operations
- Public Safety
- Public Health
- Public Service
- Economic Activity
- Cultural Resources

BGS then used the scores for criticality and vulnerability to determine building prioritization for developing mitigation measures. The risk assessment also includes information on each building's current function, construction type and year, number of floors, building replacement cost, cost of personal property and cost of computer equipment. A detailed description of this risk assessment, prioritization process and alternatives analysis for the top priority State-owned structures can be found in the [Appendix to Section 3](#).

Though the BGS project focused primarily on fluvial erosion and inundation flooding, the data acquired are pertinent to all natural hazards profiled in this Plan that could impact State-owned or leased structures. That is, a building's replacement cost will be the same regardless of what hazard was responsible for its destruction. Similarly, a building's criticality score does not differ hazard-to-hazard. Further, without high fidelity hazard mapping data for all natural hazards, determining true vulnerability of a structure based on proximity to a clearly delineated hazard area is very difficult. The full list of all State-owned buildings and their replacement costs as defined above in is the [Appendix to Section 4](#).
